

Phase 10c Bird Polish Addendum

Branch: phase-10c-final-polish-birds-balloons-filters
Purpose: make the attractor birds more legible and intentional without turning the wire into a cartoon gag.

Bird treatment update.
The wire now carries seven visible birds. Four sit in a loose center-third cluster around the courthouse zone, two sit farther outward for balance, and one visitor bird handles the occasional takeoff/landing event. The silhouettes are slightly darker and a touch larger, while the wire is 3px with a softer shadow so it reads as a deliberate power line.

Motion Behavior

- Idle motion: staggered head turns, small body shifts, and wing twitches occur across the cluster every few seconds.
- Small hop: one center-cluster bird performs a rare, short hop along the wire on a 24-second cycle.
- Takeoff/landing: one visitor bird performs a single-bird event on a 28-second cycle; the report uses the local test hook to capture the state cleanly.
- Reduced motion: bird animation, wing twitching, balloons, and other ambient motion are frozen by the existing reduced-motion media query.
